

Encode - Decode (Optimal)

class Solution:

```
def encode(self, strs: list[str]) -> str:
    result = ""
    for s in strs:
        result += str(len(s)) + '#' + s
    return result
```

```
print(Solution().encode(strs=["george", "code"]))
```

Step 1:

self -> solution instance
strs -> ["george", "code"]
result -> "" - empty string

Step 2: { for s in strs:

result += str(len(s)) + "#" + s

1st iteration:

s -> "george"

result -> "" + "6" + "#" + "george" => "6#george"

2nd iteration:

s → "code"

result → "4" + "#" + "code" ⇒ "6#george4#code" ✓

class Solution:

```
def decode(self, s: str) → list[str]:  
    result = []  
    i = 0
```

```
    while i < len(s):
```

```
        j = i
```

```
        while s[j] != '#':
```

```
            j += 1
```

```
        length = int(s[i:j])
```

```
        i = j + 1
```

```
        j = i + length
```

```
        result.append(s[i:j])
```

```
        i = j
```

```
    return result
```

```
print(Solution().decode("6#george4#code"))
```

Step 1:

self \rightarrow solution instance

s \rightarrow "6#georg 4#code"

i \rightarrow 0

Step 2: $\left\{ \begin{array}{l} \text{while } i < \text{len}(s): \\ \quad j = i \end{array} \right.$

j \rightarrow 0

Step 3: $\left\{ \begin{array}{l} \text{while } s[j] \neq "#": \\ \quad j += 1 \end{array} \right.$

j \rightarrow 1, next iteration it will skip

Step 4: length = int(s[i:j])
length \rightarrow int(s[0:1]) \rightarrow 6

s = "6#georg 4#code"
0 1 2 3 4 5 6 7 8

Step 5: $\left\{ \begin{array}{l} i = j + 1 \\ j = i + \text{length} \\ \text{result.append}(s[i:j]) \\ i = j \end{array} \right.$

i \rightarrow 1+1 \rightarrow 2

$j \rightarrow 2 + 6 \rightarrow 8$

result $\rightarrow s[2:8] \rightarrow ["george"]$

$i \rightarrow 8$

Then we iterate again from the first while loop until j becomes 9 $\Leftrightarrow \#$, after that the variable "length" becomes 4 $\Leftrightarrow s[8:9]$. Next, $i \rightarrow 10$ and $j \rightarrow 14$ and the result will be $["george", "code"]$.
